

To Overcome From the Drawback of Linear, Move to the Circular Queue

Circular Queue

- A **circular queue** has a **circular structure**.
- The last element of this queue is connected with the first element.
- Circular Queue

Figure: Circular Queue having
Rear = 5 and Front = 0

Example: circular queue with $N = 5$.

1. Initially, $\text{Rear} = -1$, $\text{Front} = -1$

2. Enqueue(5), $\text{Rear} = 0$, $\text{Front} = 0$

3. Enqueue(10), $\text{Rear} = 1$, $\text{Front} = 0$

4. Enqueue(20), $\text{Rear} = 2$, $\text{Front} = 0$.

5. Enqueue(50), $\text{Rear} = 3$, $\text{Front} = 0$.

6. Enqueue(6), $\text{Rear} = 4$, $\text{Front} = 0$

Example: circular queue with $N = 5$. Contd....

7. Enqueue(8), As $\text{Front} = 0$ and $\text{Rear} = 4 = N-1$ so **Queue overflow**.

9. Enqueue(4), $\text{Rear} = 0$, $\text{Front} = 1$

11. Dequeue(), $\text{Rear} = 0$, $\text{Front} = 2$

8. Dequeue(), $\text{Rear} = 4$, $\text{Front} = 1$.

10. Enqueue(9) As $\text{Front} = \text{Rear} + 1$, so **Queue overflow**.

12. Dequeue(), $\text{Rear} = 0$, $\text{Front} = 3$

Example: circular queue with $N = 5$. Contd....

13. Dequeue, $\text{Rear} = 0$, $\text{Front} = 4$

14. Dequeue, $\text{Rear} = 0$, $\text{Front} = 0$

15. Dequeue(), as Queue is not empty and contains only one element
So updated $\text{Rear} = -1$, $\text{Front} = -1 \rightarrow$ Queue is Empty

Operations in Circular Queue

Algorithm IsEmpty()

step1. Start

step2. if (F=-1 and R = -1) return True → Queue is Empty

step3. else return False

Step4. End

Operations in Circular Queue

Algorithm IsFull()

step1. Start

step2. if $((F=0 \text{ and } R = N-1) \text{ or } (F:=R+1)) \rightarrow \text{Queue is Full}$

return True

step3. else return False

Step4. End

Operations in Circular Queue

Algorithm EnQueue(value)

- Step 1: start
- Step2: [check for queue is over flow or not] ➔ operation Validation
 - If $((F=0 \text{ and } R = N-1) \text{ or } (F:=R+1))$
 - Print “queue is overflow”
 - go to step 5
 - else go to step 3
- Step 3: [insert item into Queue] ➔ Get the position where to insert Element
 - If $(R=-1)$ $R:=F:=0$
 - else $R:=(R+1)\%N$
- Step 4: $QUEUE[R]:=value$
- Step 5: end

Operations in Circular Queue

Algorithm DeQueue()

- Step 1: start
- Step2: [check for queue is under flow or not] ➔ operation Validation
 - If ($F = -1$)
 - Print “queue is underflow”
 - go to step 5
 - else go to step 3
- Step 3: [Copy item From Queue]
 - $X := \text{QUEUE}[F]$
- Step 4:[check condition] ➔ It is only Element of Queue or not
 - If($F=R$) $F := R := -1$ ➔ Empty Queue
 - Else $F := (F+1)\%N$
- Step 5:end

Queue Applications

- Real life examples
 - ✓ Waiting in line
 - ✓ Waiting on hold for tech support
- Applications related to Computer Science
 - ✓ Round robin scheduling
 - ✓ An electronic mailbox is a queue
 - The ordering is chronological (by arrival time)
 - ✓ Job scheduling (FIFO Scheduling)
 - ✓ Key board buffer
